

This guide will show you how to configure PokerStars and Proxifier Using the Manual Proxy Method to use Http-Tunnel.

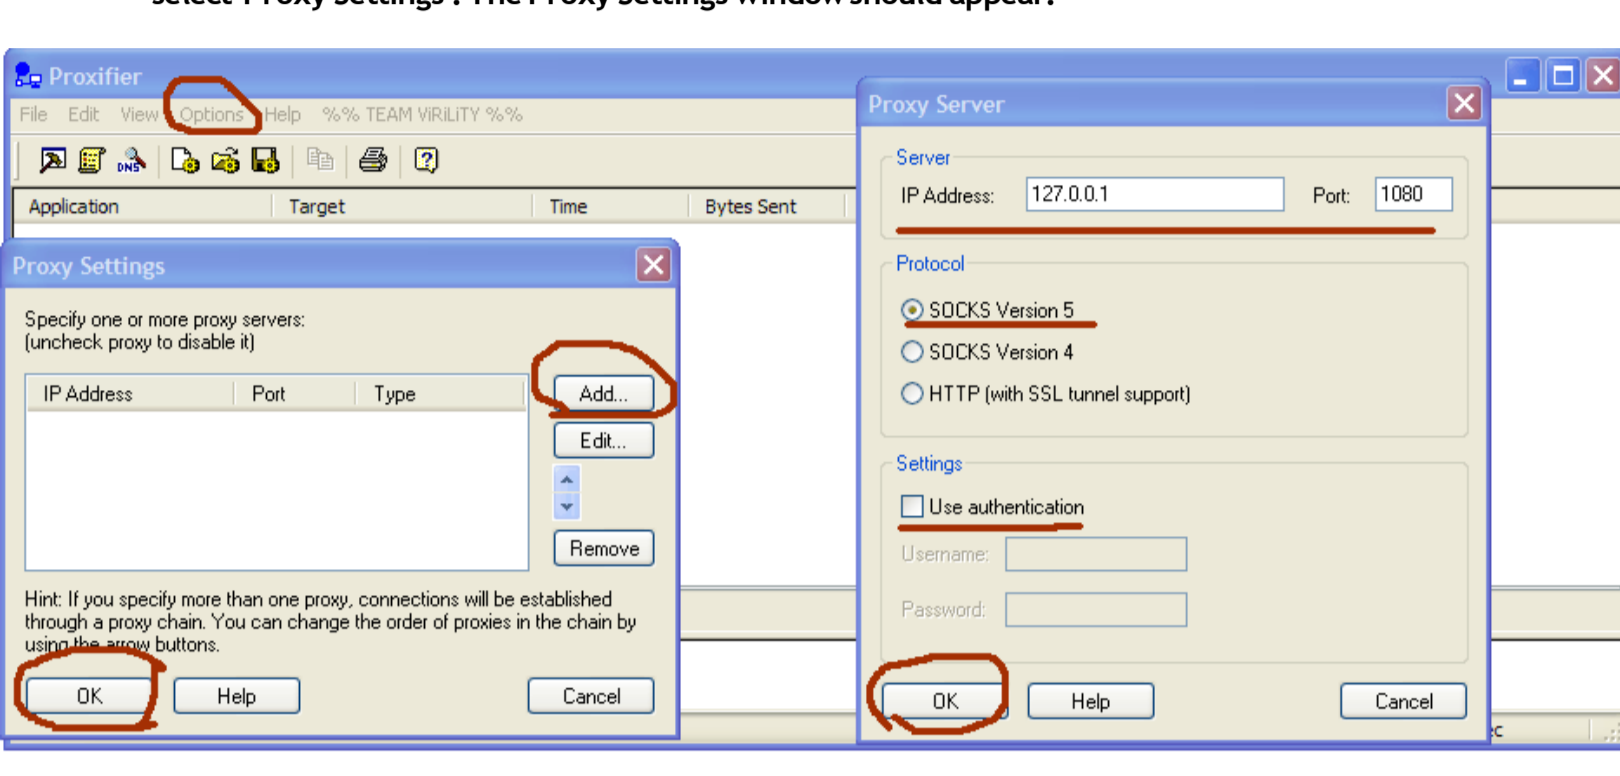

Once you have Http-Tunnel installed, run the application, The main window will appear, choose the configure option. There you will be presented with three (3) options.

1. You can Select Auto detect if you want Http-Tunnel to detect your settings.
2. No Proxy, only a firewall if this is appropriate.
3. Specify Proxy, Here you will enter the IP address and Port number of the proxy that you use. If your proxy requires authorization fill in the appropriate fields.

Complete 1 of the 3 options, then click test, the client will bind to port 1080 and localhost (127.0.0.1) by default and connect to the tunnel servers if your settings are correct.

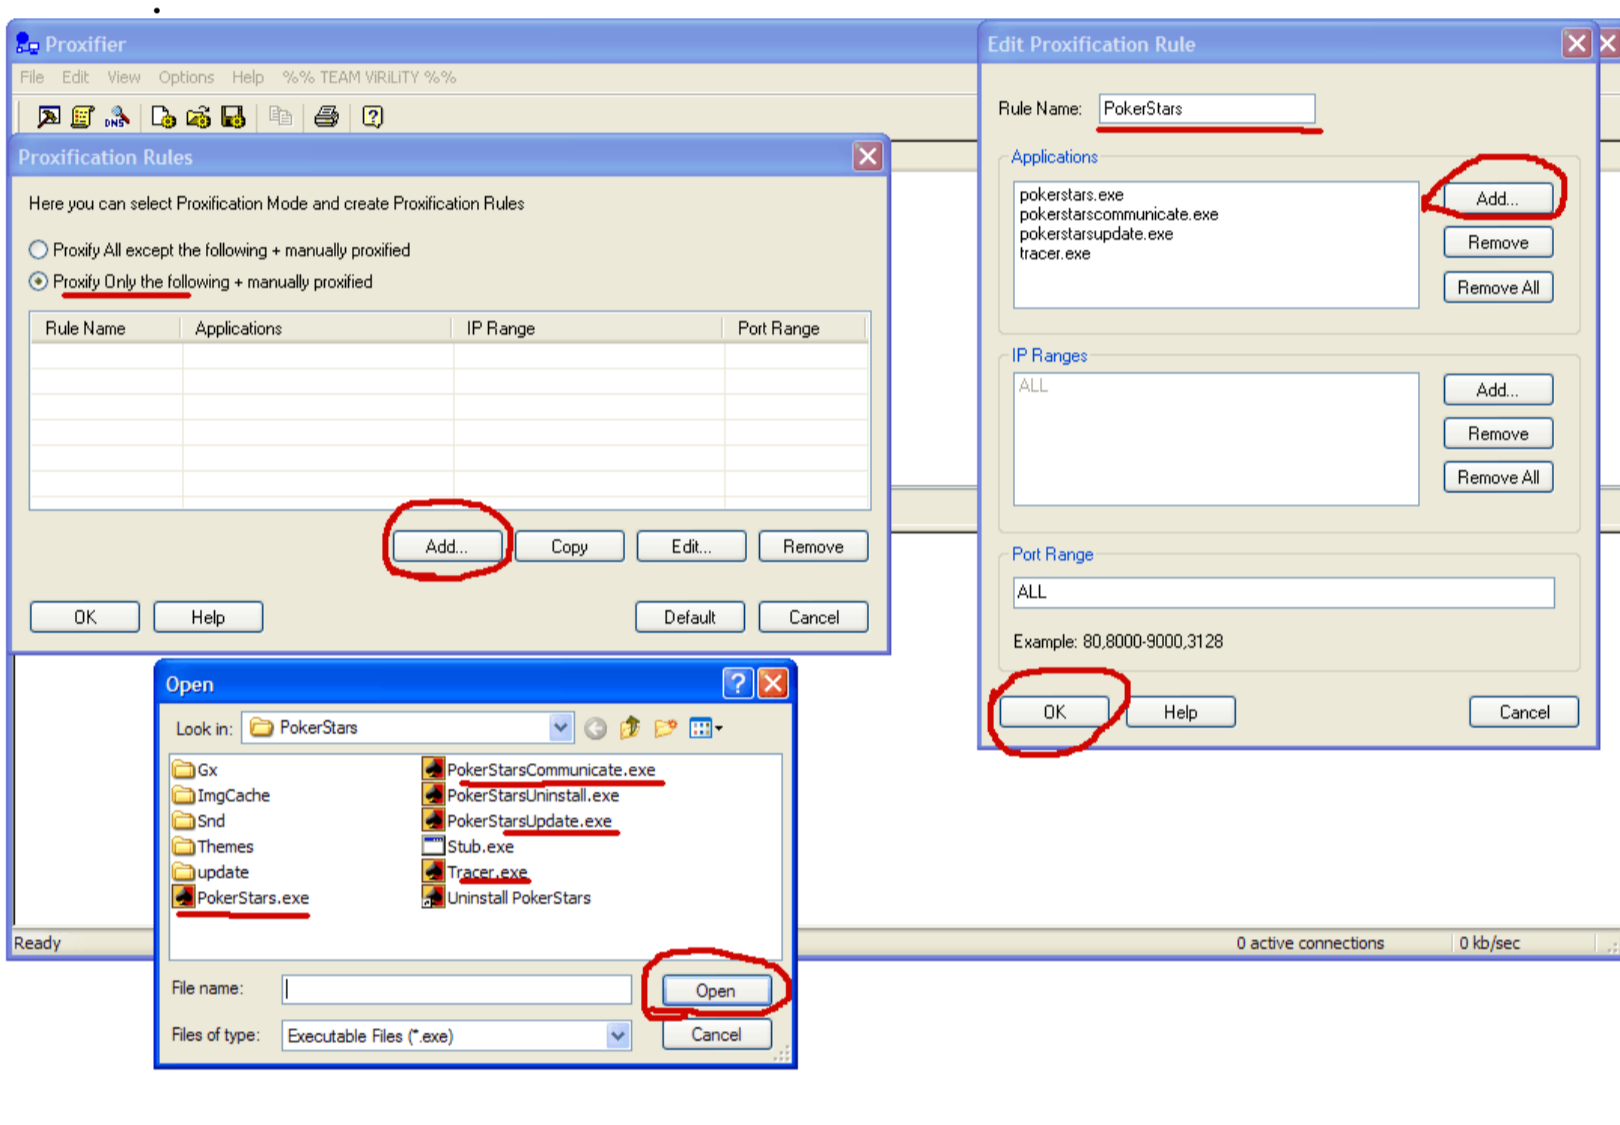

Install and run Proxifier's network setup. Run Proxifier. On the Menu bar choose Options, a pull down list should appear, select 'Proxy Settings'. The Proxy Settings window should appear.

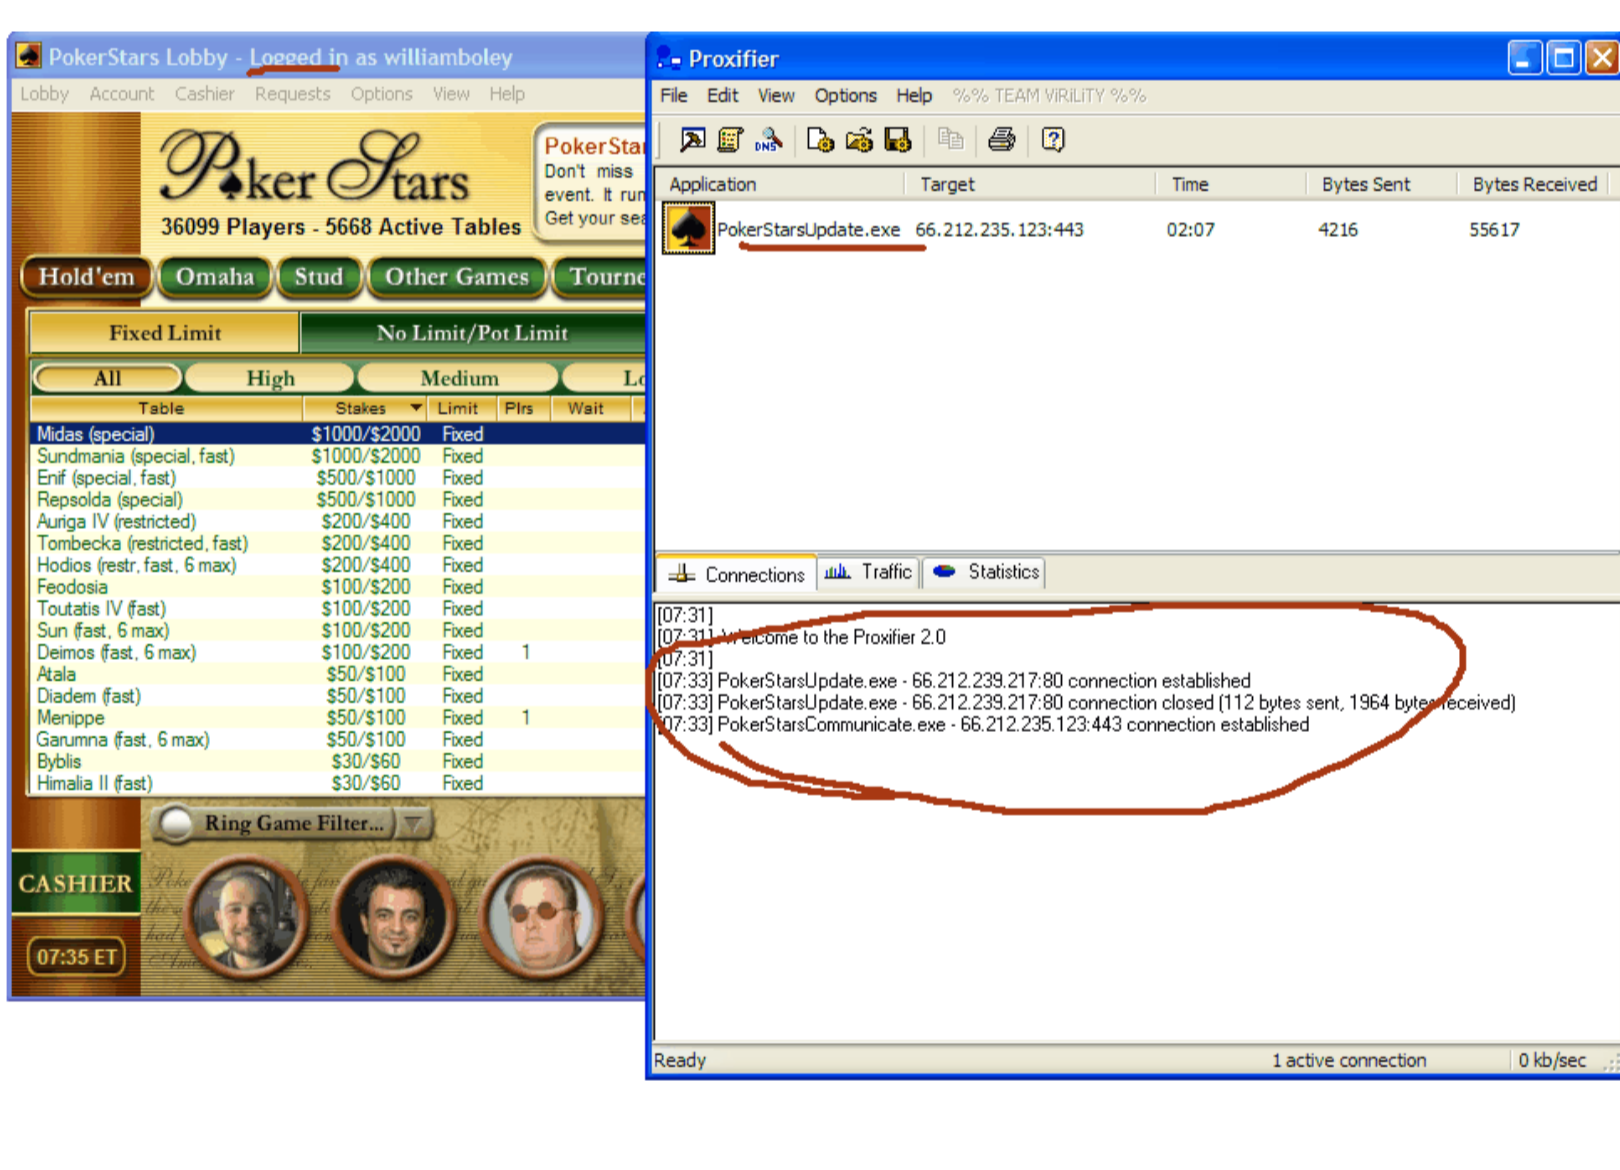

On the Proxy Settings window 'Click' the Add button, The Proxy Server window should appear. In the IP field type in 127.0.0.1 or (localhost) 127.0.0.1 works best in most cases. Then enter 1080 in the Port field. Select 1 of the 3 protocols to use, either SOCKS 4/5 or HTTP. Experimenting with these settings may determine which works best for you. If you are using a Proxy and it requires authentication be sure to fill in the proper fields. After you have completed entering in the appropriate values 'Click' the OK's as you exit.

Next: On the Proxifier menu bar 'Click' Options. A pull down list should appear. Select: Proxification Rules and 'Click' on it. The 'Proxification Rules' window should appear. Put a 'dot' in 'Proxy Only the following + manually proxified'. Next 'Click' on the Add button the 'Edit Proxification Rule' window should appear. In 'Rule Name' field give a name to your rule. Here I am naming it PokerStars as you can see. Then 'Click' the Add button in the 'Edit Proxification Rule' window. A window titled 'Open' should appear. This allows you to browse your computer for files. Use the window to browse for the .exe files of the application you want to proxy or whatever file it is you use to launch your application. Most of the time these are kept in the Program Files folder. Navigate until you find the PokerStars folder and then 'Click' it. You should see files similar to what are underlined below. You will need to insert 4 files as noted. Select 1 of the files, highlight and then 'Click' it.

You should see the file that you just 'Clicked' Loaded in to the field 'File name' in the window titled 'Open' Then 'Click' Open on the window titled 'Open'. You will then see the file has now been loaded into the 'Edit Proxification Rule' window. Do this for each of the 4 files shown. After you have done so then 'Click' OK on the 'Edit Proxification Rule' window. Then 'Click' OK on the 'Proxification Rules' window. You have now completed the manual proxification of PokerStars application files. You may want to shut down all applications including the tunnel client. Then restart the client and then Proxifier. Most of the times it will not matter. Proxifier is able to accommodate just about any start up sequence.

Now all features within the PokerStars portal are accessible. If however you 'Click' on a link that takes you outside the portal to a web page for example your default browser will be called up to access the link. In most cases this will be Internet Explorer. If the web page is blocked to you, you have 1 of two choices: Either your default browser the same way you did PokerStars or configure your browser to use the tunnel according to the instructions on the guides page: http://www.http-tunnel.com/html/support/user_guides.asp If you need additional assistance please visit the forums: <http://forums.http-tunnel.com/>
